Access Safety & Operational Analysis of Route 2 Interchanges & At-Grade Intersections in the MRPC Region

The preparation of this study has been financed in part through a grant from the Federal Highway Administration and Federal Transit Administration, U.S. Department of Transportation, under the Metropolitan Planning Program Section 104(f) of Title 23, U.S. Code. The contents of this study do not necessarily reflect the official views or policy of the U.S. Department of Transportation. Completed August 2009

Please contact George Snow at 978-345-7376 ext 312 or by email at **gsnow@mrpc.org** for more information.

The Montachusett Regional Planning Commission (MRPC) is the regional planning agency and staff for the Montachusett region (Region) serving 22 communities in North Central Massachusetts (see **Figure 1**). These communities fall within Worcester and Middlesex Counties. The MRPC carries out comprehensive regional planning in the Region. Staff of the MRPC Transportation Department develops the Transportation Improvement Plan (TIP) and the Regional Transportation Plan (RTP) and regularly conducts Region wide and community level transportation studies.

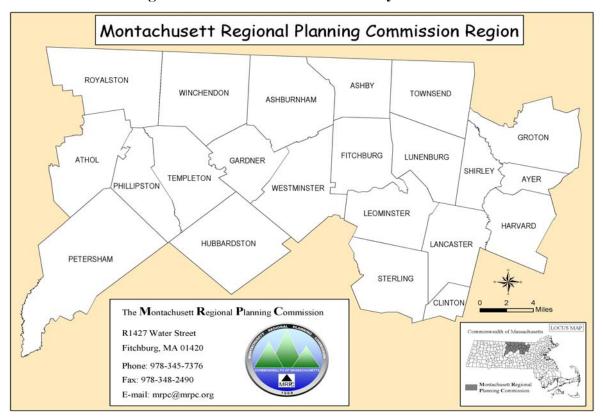

Figure 1: The Communities Served by the MRPC

The primary reason for completing this analysis is due to the ranking of most of the Route 2 interchanges and at-grade intersections in *Table 1: The Most Dangerous Intersections and Interchanges in the Region* (2002-2005) found in the *Phase I Report: Roadway Safety Conditions in the Montachusett Region*. This analysis identifies safety problem locations of Route 2 interchanges and at-grade intersections and provides operational conditions by utilizing Geographic Information System (GIS) techniques, crash statistics developed from MassHighway crash data, and ramp traffic counts conducted by MassHighway and the MRPC.

There are 22 interchanges, 7 at-grade intersections, 3 rest area at-grade intersections, and 2 weigh station area at-grade intersections in the Region. Not all 33 locations are assessed in the analysis. See **Table 1** below for the locations in the Region and the assessment status of each location.

Table 1: Locations and Assessment Status

	Locations (east to west)	Community	Assessment Status	Comment
1	Exit 38 Interchange	Harvard	Yes	
2	Exit 37 Interchange	Harvard/Lancaster	Yes	
3	Exit 36 Interchange	Lancaster	Yes	
4	Exit 35 Interchange	Lancaster	Yes	No traffic Counts ¹
5	Rest Area (WB ²) at-grade intersection	Lancaster	No	Insufficient Crash Data
6	Weight Station (EB ³) at-grade intersection	Lancaster	No	Insufficient Crash Data
7	Exit 34 Interchange	Lancaster/Leominster	Yes	
8	Rte 2 & I 190 Intersection / Exits 33 & 8 (Rte I 190) Interchanges	Leominster	Yes	No traffic Counts

26	Rest Area (EB) at-grade intersection	Templeton	No	Insufficient Crash Data
27	Exit 21 Interchange	Templeton	Yes	
28	Exit 20 Interchange	Templeton	Yes	
29	Exit 19 Interchange	Templeton/Phillipston	Yes	
30	Exit 18 Interchange	Phillipston/Athol	Yes	
31	Exit 17 Interchange	Athol	Yes	
32	Weight Station (WB) at-grade intersection	Athol	No	Insufficient Crash Data

This analysis will serve as one of several planning tools⁴ that can be used to develop safety improvement projects that work towards meeting the goals of the Massachusetts Strategic Highway Safety Plan in our Region. Although individual interchange and atgrade intersection information is provided in this analysis it is not intended to replace the need to conduct a traffic safety study of the location. Instead the information should be used as a screening tool to draw attention to the real or potential safety problem at the location.

⁴ See *Phase I Report*

I: METHODS USED TO ANALYZE ROUTE 2 INTERCHANGES & AT-GRADE INTERSECTIONS

<u>Defining Interchange Limits and At-grade Intersection Limits for Safety Analysis Utilizing GIS</u>

Interchange limits and at-grade intersection limits for safety analysis are defined by the following areas or **Crash Zones**. The Crash Zones described below belong to a GIS datalayer that interprets the method used to determine intersection and interchange crashes found in section *III: Regional & Community Crash Statistics* of the *Phase I Report: Roadway Safety Conditions in the Montachusett Region*. Crash Zones are depicted on the figures and tables in section *II: Access Safety Conditions at Route 2 Interchanges & At-grade Intersections* of this report.

1) Interchange Limits for a Route 2 major road:

Crash Zone 1: It is the area (zone) of the major road within a 1,000 foot radius of the intersection that exists where the major road and the acceleration and/or deceleration lanes respectively merge and/or diverge. This accounts for crashes that occur as a result of high speed differentials between ramp traffic and highway thru traffic and also the merging and weaving of traffic in the travel lanes.

2) At-grade Intersection Limits for a Route 2 major road:

This is the 1st of only 2 Crash Zones at Route 2 at-grade intersections.

Crash Zone 1: The same radius used to determine *Interchange Limits for a Route 2 major road* is applied to the major road. The limits on the major road is the area (zone) of the road within a 1,000 foot radius of the at-grade intersection. This accounts for crashes that occur as a result of high speed differentials between minor street traffic trying to merge into highway thru traffic and the weaving of traffic in the travel lanes. These intersections have very short or non existent acceleration and deceleration lanes. Four are stop controlled on the minor approach and two are signalized (WB flashing). The 1,000 foot radius is also applied to rest area and weigh station area at-grade intersections.

Crash Zone 1 Overlaps:

Crash Zone 1 overlaps occur between several interchanges and at-grade intersections due to their proximity to each other. The overlap areas are a safety issue because they add merging, diverging, and weaving traffic to the safety analysis limits of interchanges and at-grade intersections. The crashes that fall within the overlaps are attributed to only one interchange or at-grade intersection. **Table 2** below provides the locations and the **Figures** in section *II* show where the overlaps occur.

 Table 2: Crash Zone 1 Overlaps

Locations (east to west) (E = Exit)		
E 35 Interchange (Fig 5) / Rest Area (WB) at-grade intersection / Weight Station (EB) at-grade intersection / E 34 Interchange (Fig 6) / Rte 2 & Rte I 190 Intersection-E 33-E 8 (Rte I190) Interchanges (Fig 7)		
Abbott Ave (EB) at-grade intersection (Fig X) / Exit 30 Interchange (EB) (Fig X)		
Exit 28 Interchange (WB) (Fig X) / Exit 27 Interchange (WB) (Fig X)		
Exit 26 Interchange (EB) (Fig X) / Exit 25 Interchange (EB) (Fig X)		
Exit 24 Interchange (Fig X) / Exit 23 Interchange (Fig X)		

3) Interchange Limits for a Route 2 interchange access road and ramp intersections: Crash Zone 2: The radius used to determine intersection crashes is applied. Interchange Limits for the minor access road and ramp intersections is the area (zone) of the road within a 200 foot radius of the intersections. However, a smaller radius is applied to ramp approaches of several interchanges due to ramps having either a tight radius or inadequate length. In either case, vehicles must reduce speed very rapidly entering the ramp then increase speed very rapidly before merging either with Route 2 or minor road traffic. The radius varies for ramp to ramp. Table 3 provides the interchanges and the interchange figure numbers which can be seen in section II.

Table 3: Interchanges with Different Crash Zone 2 Radii

Interchanges (E) & (Fig #)	Direction	ON Ramp Radius*	Origin of ON Ramp Radius	OFF Ramp Radius*	Origin of OFF Ramp Radius

E 31 (Fig 9)	EB	150	Ramp & Minor Street Intersection	150	Ramp & Minor Street Intersection
		*in feet			

Crash Zone 2 takes several geometric forms depending on the number of roads involved. The four examples described below are provided to show the diversity of forms this crash zone takes:

- Zones where each on and off ramp is used to direct traffic in one direction only. This forms only one intersection between the ramp and the minor access road where crashes could occur. See Exit 38 which has two intersections for each pair of adjacent on and off ramps.
- Zones where a combined on and off ramp has two-lanes for two-way traffic with no median that directs traffic in two directions for off traffic and one direction for on traffic (see Exit 18). This forms six intersections between the ramp and the minor access road and one intersection where the on and off lanes diverge for a total of seven intersections where crashes could occur.
- Zones where a single lane ramp is used solely as either an on or off ramp that either directs traffic in two directions for off traffic or one direction for on traffic (see Exit 18). This forms three intersections between the ramp and the minor access road where crashes could occur.
- Zones which are similar to those described in the above Zones description but the on and off ramps are side by side each having its own lane separated by a median (see Exit 24). The zone either directs traffic in two directions for off traffic or one direction for on traffic. This forms five intersections between the ramp and the minor access road where crashes could occur.

- 4) At-grade Intersection Limits for a Route 2 minor road:
 This is the 2nd of only 2 Crash Zones at Route 2 at-grade intersections.

 Crash Zone 2: The radius used to determine intersection crashes is applied to the minor road. Intersection Limits on the minor road is the area (zone) of the road within a 200 foot radius of the intersection.
- 5) Crash Zone 3: If applicable, it is the remaining area (zone) of the road on the ramps between the major road (Route 2) and the Crash Zone 2 radii.
- 6) Crash Zone 4: If applicable, it is the remaining area (zone) of the road on the travel lanes of the major and minor roads between either the Crash Zone 1 radii or the Crash Zone 2 radii respectively.
- 7) Undetermined Crash Zone: This is not a Crash Zone. Crashes are placed in this category if their Crash Zone could not be determined. This situation occurs at interchange grade separations.

<u>Interchange and At-grade Intersection Crash Statistics</u>

This analysis utilizes three MassHighway crash related GIS datalayers to develop the crash statistics. The first and second are the 2003 GIS located crashes and the 2004-2006 GIS located crashes datalayers which are joined to create one datalayer. This joined datalayer provides GIS **X** and **Y** coordinate location information for crashes that could be successfully located based on available location information. To develop the crash statistics from the attributes of the datalayer, MRPC staff analyzed the attribute fields that address *Crash Severity*, and *Most Harmful Event* (MHE). *Crash severity* states the types of harm or the most serious outcome of a crash. There are essentially three possible outcomes:

- 1. *Fatal Injury* crash: Is the worst type of harm that involves at least one fatality or death of a person.
- 2. *Non-fatal Injury* crash: Is the second worst type of harm that involves at least one injury to a person.
- 3. *Property Damage Only* (*PDO*) crash: Is the third worst type of harm that involves damage to property of any type.

The Equivalent Property Damage Only (EPDO) crash severity rating system was used to determine an EPDO Total for each interchange or at-grade intersection. EPDO rates a crash based on crash severity that gives one (1) point to a PDO crash; five (5) points for a crash involving at least one Non-fatal Injury; and ten (10) points to a crash that involves at least one Fatal Injury. In other words, one Fatal Injury crash equals two Non-fatal Injury crashes and ten PDO crashes. After determining each crash EPDO rate, the ratings of the crashes for each interchange or at-grade intersection are totaled. A high EPDO total indicates a dangerous interchange or at-grade intersection where crashes have the most severe consequences.

MHE states the worst type of harm that occurs during a crash for each vehicle involved. Some examples include: a crash with - Motor Vehicle in Traffic (MVT); Pedestrian; Wildlife; Work Zone Maintenance Equipment; Tree; Utility/Light/Other Pole; Guardrail; Median Barrier; Embankment. Some other events include: Fire/Explosion; Jackknife.

The third GIS datalayer is the 2005 **Crash Clusters** (which are polygons; a GIS area feature) datalayer that aggregates 2003-2005 crash data that occurs at a location which allows analysts to better evaluate the total crash experience at a location. According to the MassHighway description, the method used to create Crash Clusters is based on the following:

"At the heart of the method ... is a 25 meter (82 feet) fixed search distance (radius) around each crash. In basic terms, this radius controls how far the application will search for adjacent crashes. Using a 25 meter radius, the analysis method found nearby crashes and merged their areas together, thus creating (crash) clusters (which are polygons; a GIS area feature)."

This produces Crash Clusters of various sizes and shapes. However, not all crashes are captured in a Crash Cluster. There are remaining single crashes that occur at a location outside a Crash Cluster. These are called **Non-Cluster crashes**. In this safety analysis Crash Clusters are the primary tool used to identify problem locations within a Crash Zone. Non-Cluster crashes are the secondary tool used to assist in identifying problem locations within a Crash Zone.

Two important decisions were made based on the fact that Crash Clusters are based on 2003-2005 crash data and the safety analysis includes 2006 crash data. First, if a 2006 crash falls within the boundary of a Crash Cluster the crash is included in the analysis of the cluster but a new Crash Cluster is not created. Second, new Crash Clusters were created if at least one 2006 non-cluster crash is located within a 25 meter radius of a 2003-2005 Non-Cluster crash for the purpose of identifying other potential problem locations.

Finally, all crashes that occurred at interchange grade separations are grade-separated and placed in a respective Crash Zone but retain the same Crash Cluster ID designation. Not all crashes could be grade-separated due to a lack of data and the Crash Zone is Undetermined as described above. Crash Clusters and their respective crashes, and Non-Cluster crashes are identified in the figures and tables in section *II*.

II: ACCESS SAFETY CONDITIONS ON ROUTE 2 INTERCHANGES & AT-GRADE INTERSECTIONS

The analyses presented below provide results for each interchange and at-grade intersection that was analyzed. See the *Appendix* for the MHE analysis tables. Contact the MRPC for the traffic count reports that were used to develop the traffic volume information depicted for each location in this study.

Description of Interchange or Intersection Analysis Results Page

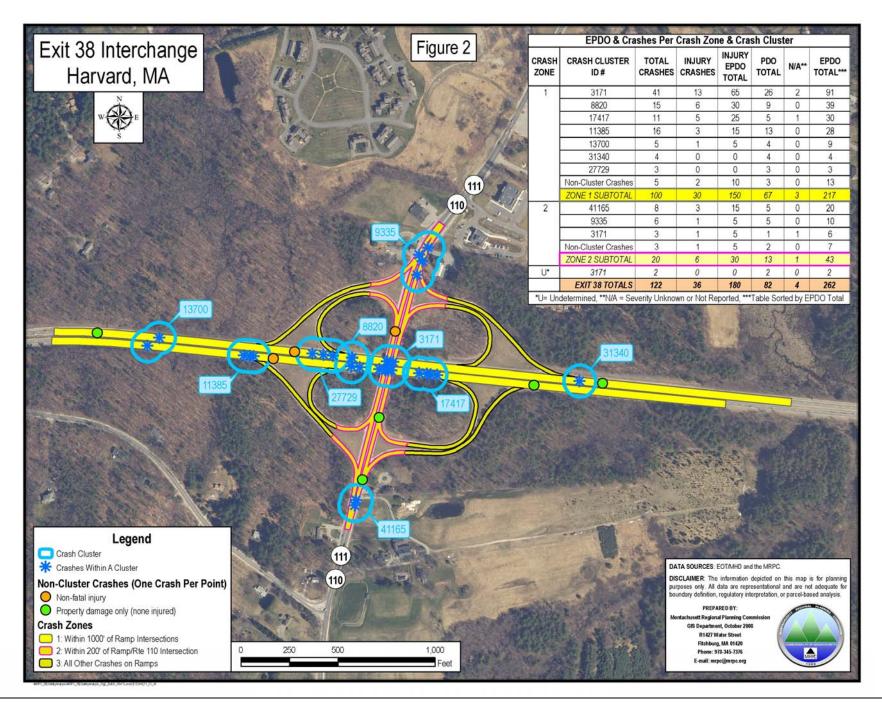

The analysis pages provide the following information for each interchange and intersection:

- Types of traffic control devices.
- Informs reader if a recently completed project changed the geometry which will most likely affect crash occurrence.
- The Phase I Report dangerous location rank.
- Total EPDO results differences between results determined in this study and the Phase 1 Report.
- Percentage non-fatal/fatal injury crashes. Safety is a problem to be addressed if the non-fatal/fatal injury crash percentage is equal to or greater than 30% of the total number of crashes.
- The most dangerous Crash Zone. Safety is a problem to be addressed within a Crash Zone if the Crash Zone EPDO total is equal to or greater than 30% of the Total EPDO.
- The most dangerous Crash Cluster(s) and/or Non-Cluster crashes within the Crash Zone. Safety is a problem to be addressed within a Crash Zone if the Crash Cluster and/or Non-Cluster crashes EPDO total is equal to or greater than 30% of the Total EPDO.
- The Top 3 MHE and significant MHE results.
- Location patterns of Crash Clusters and Non-Cluster crashes within a Crash Zone(s).
- Analysis conclusions, recommendations, and problematic geometric issues.
- Informs reader if a proposed project is in the planning stages.
- Ramp traffic count summaries with peak hours are provided if counts were taken. The ramps are ranked using the following method:

Ramp Peak Traffic Count Rank
1 (peak)
2
3
1
4

Most Significant Results: CZ 1 accounts for 72.5% of #1 & #2 Top 3 MHE.	
H Location Patterns of Crash Clusters:	
Clusters in section E above are approximately within 650 feet of each other and are located on a road segment v	here
Rte 2 & Rte I-190 merge and 4 lanes merge down to 2 lanes.	
Cluster in section F above is located on the EB road segment under the WB bridge.	
Location Patterns of Non-cluster Crashes:	
Zone 1: 2 Non-Cluster crashes are just outside Cluster 17942.	
J Analysis Conclusions & Recommendation:	
The results of the analysis indicate that 33% of the EPDO Total occurred in CZ 1 at the Rte 2 & Rte I-190 into	rsection
where	
where traffic must merge from 4 lanes down to 2 lanes, vehicles weave to change lanes, and vehicle speed	s vary.
Also, 24% of the EPDO Total occurred in the Rte 2 EB lane near the Rte I-190 bridge that includes Crash Clus	er 39647
Combined these two locations account for 56% of the EPDO Total of this intersection/interchange transportation	J. 000T1.
Recommend Further Study of the following to improve safety	
The highest priority location is the WB Rte 2 & Rte I-190 intersection merge in CZ 1 that includes Clusters 1794	
The second location is in the Rte 2 EB lane in the area of the Rte I-190 bridge in CZ 4 that includes Cluster	on facility. 2 & 5619.
K Ramp Traffic Counts Summary: No traffic counts taken.	on facility. 2 & 5619.
*30% & higher considered significant in this analysis.	on facility. 2 & 5619.

	accel/decel lanes. Cluster 10691 is located approximately 350 feet west of	a decel lane that includes Clu	uster 4722.
	The length of Rte 2 roadway that Clusters 4722, 3399, & 13954 cover is ap	proximately 1,300 feet.	
Zone 2:	3% of the EPDO of Cluster 3399 is located on the SB lane of the Rte 12 br	•	
Zone 4:	7.6% of the EPDO of Cluster 3399 is located on the NB lane of the Rte 12	bridge.	
/			

(continued next page)

Exit 31 Interchange Access Safety Analysis Results (continued)

Analysis Conclusions & Recommendation:

The results of the analysis indicate that 80% of the EPDO Total occurred in between and at the outer accel/decel lanes.

These are Crash Zone 1 locations where vehicles are at the highest speed differentials and where merging and weaving take place.

Geometric Issues:

The following 2 major geometric issues combine to create a severe roadway safety hazard at this interchange:

The inner loops are within approximately 300 feet of each other.

A combined steep vertical curve & significant horizontal curve begin at Route 12 heading west.

Recommend Further Study of the following to improve safety

The highest priority location is between & at the outer accel/decel lanes that includes Crash Clusters 3399, 4722, &13954.

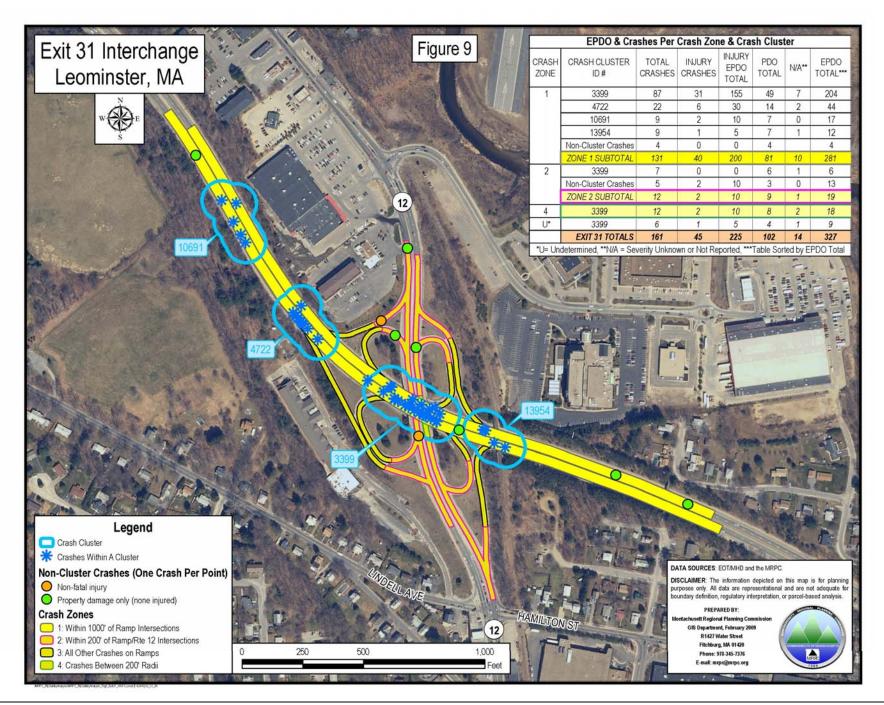

The second highest priority is the Rte 12 bridge over Rte 2 that includes Crash Cluster 3399.

The third highest priority location is the EB deceleration lane that includes Crash Cluster 10691.

Exit 31 Interchange Project Info:

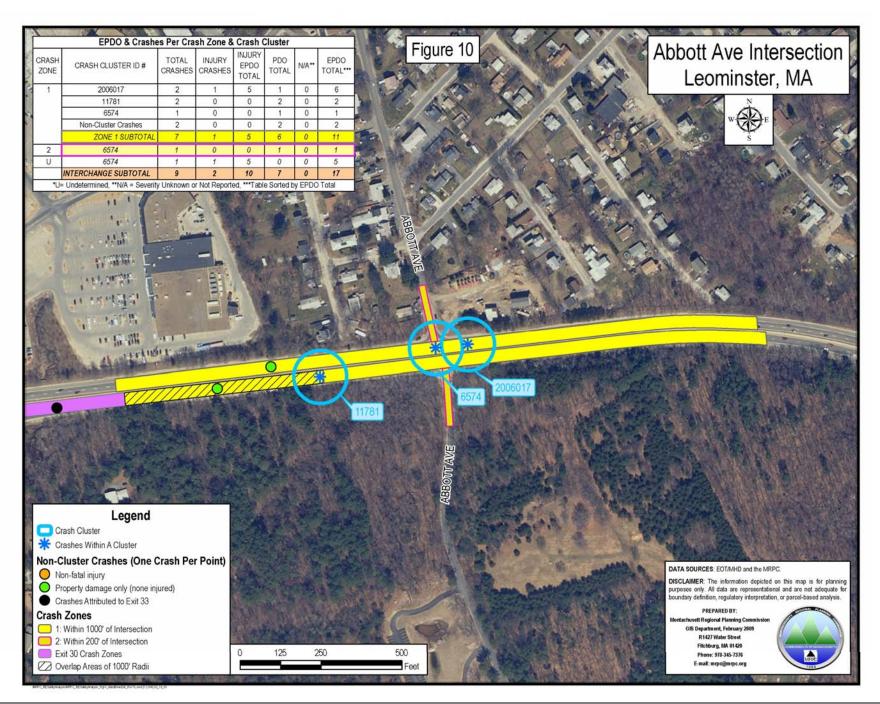

Major improvement projects that include a bridge replacement are being planned for this interchange

Major improvement projects that include a bridge replacement are being planned for this interchange.

Location Patterns of Crash Clusters:		
Clusters 12852, 709, & 36078 are located at the ramp/Main St & Rte 140 intersection.		
Zone 2: Clusters 12852, 709, & 36078 are located at the ramp/Main St & Rte 140 intersection. Zone 4: Cluster 21678N/SB is located on Rte 2A/140 approximately 350 feet north of Cluster 709.		
Zone 1: Clusters 670 & 21678WB are located at the Rte 2 WB deceleration lanes.		
Cluster 19124 is located at the Rte 2 EB decel lane. Cluster 21678EB is located approximately 530' west of Cluster 19124.		
Location Patterns of Non-cluster Crashes:		
Zone 1: 2 WB Non-Cluster crash are located approximately within a 500 foot radius of Clusters 670 & 21678. 1 EB Non-Cluster crash is located approximately 230 feet west of Cluster 21678.		

(continued next page)

Exit 25 Interchange Access Safety Analysis Results (continued)

Analysis Conclusions & Recommendation:

The results indicates that 44% of the EPDO Total occurred approximately within a 1,100 foot section of CZs 2 & 4.

This is a section of Rte 2A/140 that includes Clusters 21678, 12852, 709, & 36078.

The results also indicates that 46% of the EPDO Total occurred within a 530 foot radius of Rte 2 deceleration lanes. These are locations where vehicles are at the highest speed differentials and where merging and weaving take place.

Recommend Further Study of the following to improve safety

The 1,100 foot road segment that falls within CZs 2 & 4 described in section E & G above is the highest priority location.

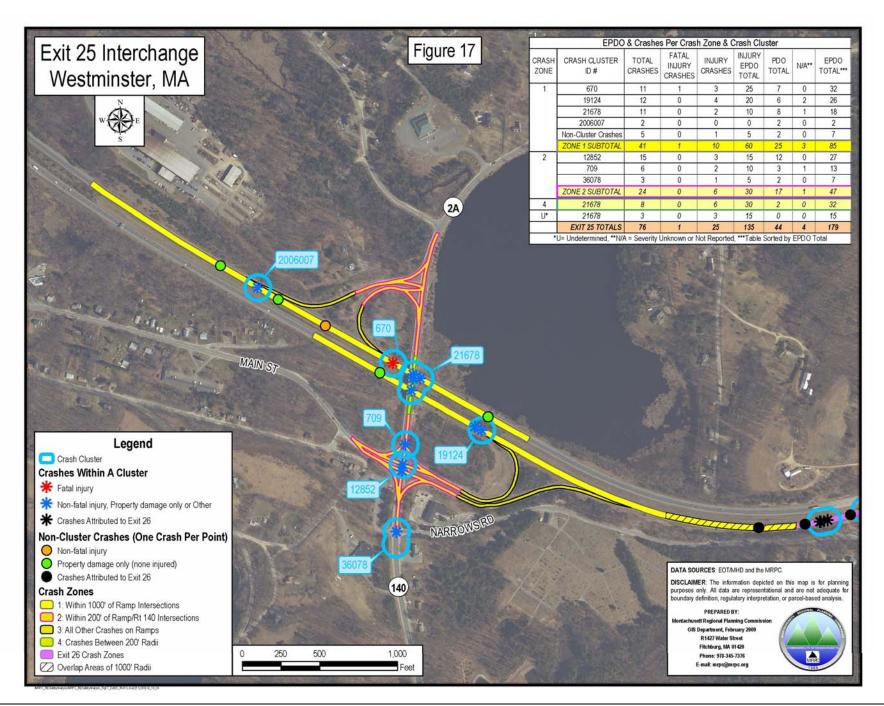

The second highest priority is the WB decel lane on Route 2 that includes Crash Clusters 670 & 21678WB.

The third highest priority location is the EB decel lane on Route 2 that includes Crash Clusters 19124 & 21678EB.

(continued next page)

Exit 24 Interchange Access Safety Analysis Results (continued)

K Analysis Conclusions & Recommendation:

The results of the analysis indicate that 40% of the EPDO Total occurred approximately within a 300 foot radius of the EB acceleration & deceleration lanes.

Also, 31% of the EPDO Total occurred approximately within a 990 foot radius of the WB decel lanes. This are locations where vehicles are at the highest speed differentials and where merging and weaving take place.

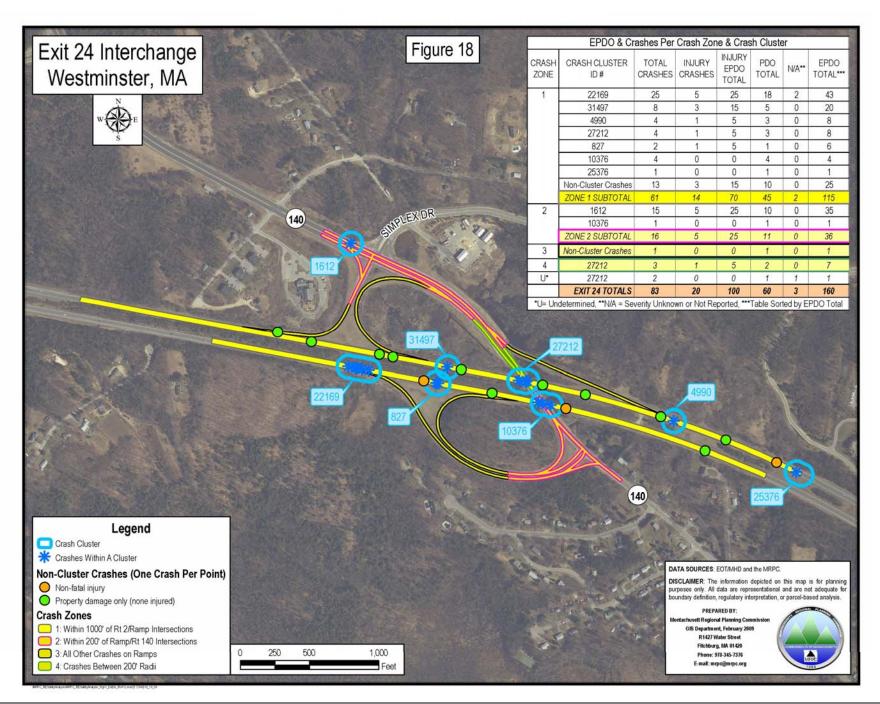

Recommend Further Study of the following to improve safety

The EB 1,600 foot roadway segment that falls within CZ 1 described in sections E, I, & J is the highest priority location. The WB 3,200 foot roadway segment that falls within CZ 1 described in sections F, I, J is the 2nd highest priority location. The third highest priority location is in Crash Zone 2 that includes Cluster 1612.
